Introduction

The Connector Step allows you to exchange data between forms in your workflow and external sources.

To add this step to your workflow, click the "**Add Step**" button on your Map and then select **Add a Connector** from the dropdown menu. You can also hover over the space in between Steps and the "+" icon will appear.

You can edit or delete a connector at any time by selecting it on the Map and opening the **Properties** panel.

When you add a connector to a workflow, it will run separately from your individual forms and form-level connectors. **Form-level connectors will not run in a workflow, and workflow-level connectors will not run in forms.** Additionally, any connectors you set up for a form in one workflow will not run in any other workflows that use the same form.

Note: If you change the form associated with the connector in your workflow, or change the type of connector in the Properties Panel, **the connector configuration will be lost** and it will need to be reconfigured. We strongly recommend finalizing your forms and their arranged order on the workflow before finalizing your connectors, to avoid needing to reconfigure.

Rules for Adding Connectors to Workflows

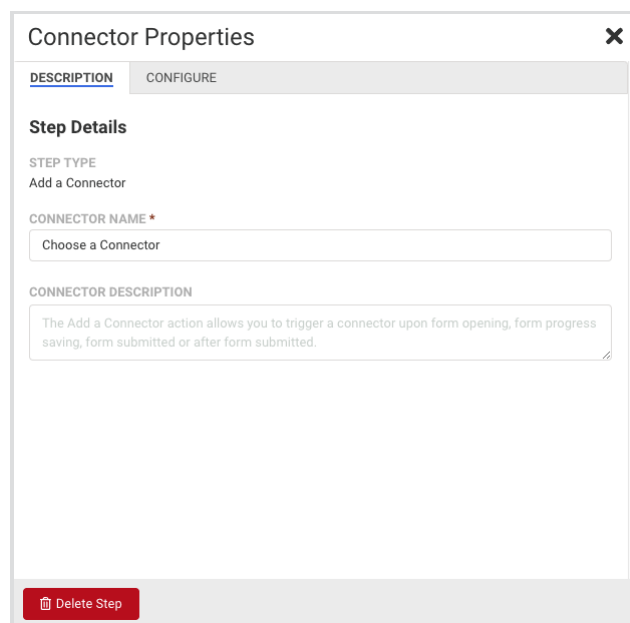

The position of the connector matters.

- Prefill Connectors must be placed before a Form Step or another Prefill Connector.
- A Submit Connector can be placed anywhere in a workflow after the Start Workflow Step and will be tied to the form you set in the Configure tab.
- If a connector is tied to a form and then runs **before** the next Redirect Step (either a redirect or another form), it will notify respondents of any connector errors and will prevent submission if an error occurs. This is the same as the Form Submitted portion of the Connector Timeline seen at the form level.
- If a connector is tied to a form and runs **after** the next Redirect Step (either a redirect or another form), it will **not** notify respondents of any connector errors. This is the same as the After Form Submitted portion of the Connector Timeline seen at the form level.

Properties Panel Configuration

Adding a connector will automatically open the Properties panel so that you can configure the step. The Properties panel for this Step contains the following tabs: **Description**, **Configure**, and **Error Handling**.

You can delete any step by opening the Properties panel for the step and clicking the red "**Delete Step**" button at the bottom.

The screenshot shows a modal window titled "Connector Properties" with a close button (X) in the top right corner. It has two tabs: "DESCRIPTION" (active) and "CONFIGURE". Under the "DESCRIPTION" tab, there is a section "Step Details" containing "STEP TYPE" (Add a Connector), "CONNECTOR NAME" (with a dropdown menu showing "Choose a Connector"), and "CONNECTOR DESCRIPTION" (with a text area containing the text: "The Add a Connector action allows you to trigger a connector upon form opening, form progress saving, form submitted or after form submitted."). At the bottom of the panel is a red button labeled "Delete Step" with a trash icon.

Description Tab

This tab handles the details of the step itself, such as the Step Name and Step Description.

- **Step Name** - This field allows you to give the step a custom name, which can help you differentiate between your steps. It has a default value of "Choose a Connector" until manually changed, or until a connector is

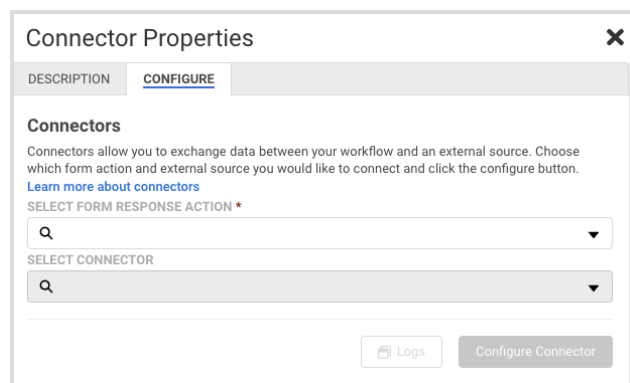

selected in the Configure tab. If a connector is selected in the Configure tab, the default name will automatically change to match the connector.

- **Step Description** - You can use this field to add a description to your step.

Configure Tab

When you first open the Configure tab, you will see the fields **Select Form Response Action** and **Select Connector**, followed by a **Configure Connector** button. These two fields determine which form is collecting data for the connector, and which connector this step executes.

- **Select Form Response Action**
 - This field contains a dropdown menu that lists:
 - All Form Steps located above this step in the Workflow Map
 - A Form Step, if it is located directly after this step (for Prefill Connectors)
 - A Form Step, if this step is located **immediately before** another Prefill Connector, which is directly above the Form Step in question
 - You can also use the type-ahead input to narrow down the list of available steps. The dropdown menu will list the Step Names, not the names of the forms, so please keep this in mind when setting any custom Step Names.
- **Select Connector**
 - This field is disabled until the Form Step has been selected in the field above. It contains a dropdown menu that shows all available connectors for this Step. The list of connectors will be affected by the placement of the step as well. For example, you will see a list of Prefill Connectors if this step is directly above a Form Step.

The screenshot shows a dialog box titled "Connector Properties" with a close button (X) in the top right corner. It has two tabs: "DESCRIPTION" and "CONFIGURE", with "CONFIGURE" being the active tab. Under the "Connectors" section, there is a text block explaining that connectors allow data exchange between a workflow and an external source, followed by a link to "Learn more about connectors". Below this, there are two dropdown menus: "SELECT FORM RESPONSE ACTION" and "SELECT CONNECTOR", both with search icons. At the bottom right, there are two buttons: "Logs" and "Configure Connector".

- **Configure Connector**
 - This button is disabled until a connector has been selected in the above field. Clicking on this button will open a **Connector Configuration** page where you can set up your connector. This page uses the same configuration settings as the form-level Connector Configuration pages, so you can [reference the related help documentation for each connector](#) when configuring them.

Note: Before clicking **Configure Connector** you must have pop-ups **enabled** in your browser. Otherwise, you will not be able to access the correct configuration screen for your connector.

Error Handling Tab

With this tab, you can set a custom error message that displays if an error occurs. The custom error message can be applied to any **Prefill**, **Save**, or **On-Submit Connector**.

For example, if an error occurs when sending form data to Salesforce on-submit then the error message from Salesforce is typically displayed to the respondent. These errors can confuse to form respondents, so you can display a custom error message instead.

The screenshot shows a 'Connector Properties' dialog box with a close button (X) in the top right corner. It has three tabs: 'DESCRIPTION', 'CONFIGURE', and 'ERROR HANDLING'. The 'ERROR HANDLING' tab is selected and contains the following content:

Error Handling
Custom error messages are shown to respondents when a connector error occurs. Leaving this field blank will result in showing the default connector error.
[Learn more about custom error messages](#)

CUSTOM MESSAGE

☐ Show connector generated error message below your custom error

At the bottom left of the dialog is a red button labeled 'Delete Step'.

- **Custom Message**

- You can enter plain text (no HTML) into this text area to create your custom error message. The custom error message will be shown to the respondent if they encounter an error from the connector while responding to the form. The error will be styled according to the Form Theme's "**Error Color**" option.
- You can also choose to display the connector-generated error message below your custom error, by checking the checkbox below the text area. This can be helpful when the generated error messages display useful information to the respondent, such as whether a credit card payment failed. This option is **highly recommended** for Payment Connectors.

Available Connectors

- Salesforce Prefill (only before the first form)
- Salesforce Marketing Cloud Prefill (only before the first form)
- FreshBooks
- Google Sheets
- Microsoft Excel
- HTTPS
- Salesforce Marketing Cloud
- Salesforce
- Authorize.net
- CyberSource
- iATS
- PayPal
- Stripe

Prefill Connectors and Workflow

To prefill a form within a workflow, you'll first need to configure the Form Step that will be prefilled. This is because a Connector Step shows a different list of available connectors based on which Form Step it is referring to. To show Prefill Connectors, you'll need to reference a Form Step **after** the Connector Step in the Workflow Path.

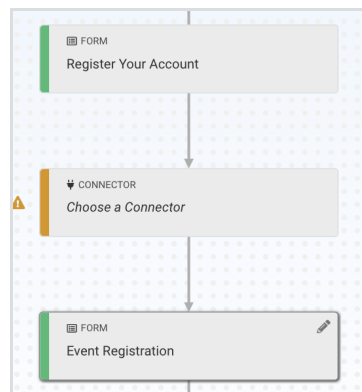

Prefill Connectors can run in one of two locations within a workflow:

1. You can run a prefill connector before a Form Step.
2. You can run a prefill connector at the start of a workflow.

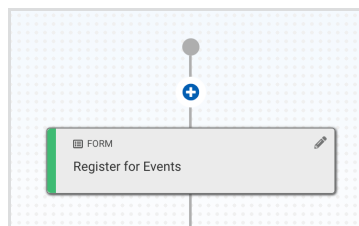

Follow the steps in the sections below to prefill in one of these two locations.

Prefilling Within a Workflow

1. Add a Form Step anywhere inside the workflow and configure the form which will be prefilled.

2. Once the Form Step has been added and configured, hover over the space above the Step in your workflow. A "+" icon will appear to add a new step.

Click on the "+" icon and then select to add a new Connector Step.

3. Under "**Select a Form Response**", choose the form which you will be prefilling.
4. Under "**Select Connector**", choose the prefill connector which you would like to run.
5. Click **Configure Connector** and set up your Prefill Connector.
6. Authenticate your Prefill Connector first. [Reference our help documentation](#), if you need assistance authenticating a Prefill Connector.
7. Set up your Lookup.
 - Set the Salesforce field you'll be searching for on the left
 - Choose "**Equals**"
 - Set the rightmost field to "**a workflow parameter**"
8. For the **parameter**, use simple, case-sensitive text that does not contain numbers or special characters. If you've set up a Salesforce Prefill Connector before, this will function like an [unsafe query parameter](#).

LOOKUP #1
Use this query to lookup a Contact record:

Email Equals a workflow parameter:

Enter the name of the query string parameter.

Enter the name of the workflow parameter. Use this parameter in the connector step properties to link this lookup to your workflow.

9. Finish setting up your Prefill Connector and **Save** before closing the configuration window.

10. Add your Workflow Parameters to the step.

- In the Connector Properties panel, open the **Configure** tab and scroll to the bottom.
- You'll see a section labeled Workflow Parameters.

Workflow Parameters
If your prefill connector uses workflow parameters configure the value mapping below.
[Learn more about Workflow Parameters.](#)
Add Parameter

- Click **Add Parameter**.
- On the left, fill the **Parameter** box with the parameter that you set for your Prefill Connector Lookup (step 8).
- On the right, you can use the **Formula Editor** in the **Value** box to create a formula or select a field from a previous form. This value will be your **search value**. The Lookup will search Salesforce for records where the **parameter** field matches the **search value**. To learn more about prefilling with parameters, [reference this help documentation](#).

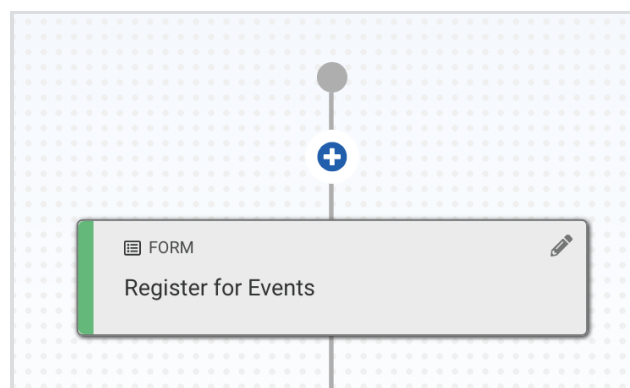

PARAMETER *	VALUE
email	%%step_1!tfa_5%%

- Add as many parameters as needed.

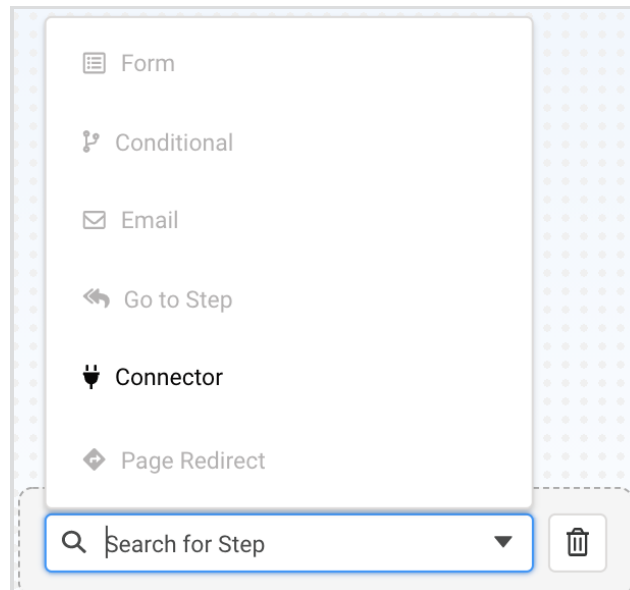

11. **Save** your workflow to complete the setup.

Prefill When Workflow Starts

To add a Prefill Connector to the beginning of your workflow, you'll need to first add your starting form. Once your first Form Step has been added and configured, you can hover over the space above the Step. A "+" icon will appear to add a new step.

Click on the "+" icon and then select to add a new Connector Step.

When prefilling at the start of a workflow, you will need to append the prefill parameters to the end of your Workflow URL. You can [follow the instructions here](#) to build your prefilled link.

Note: Be sure to use the **Workflow URL**, rather than the URL of the form, so your respondents remain in your workflow rather than exit to just the form.

When starting a workflow with a Prefill Connector, use the traditional prefill parameters of **formula**, **secure query**, or **unsafe query**. Workflow Parameters will not work at the beginning of a workflow because there aren't any preceding steps to pull the information from.

Once you have built your prefilled link, you can configure the Prefill Connector as usual. Please follow the steps in the documents below, as you configure your connectors:

- [Salesforce Prefill Connector](#)
- [Salesforce Marketing Cloud Prefill Connector](#)
