## Overview

Our WordPress Plugin makes it easy to add a FormAssembly form to a WordPress blog post or page. The plugin is compatible with PHP 7 and we keep it up to date with the latest version of WordPress.

---

## Download

The FormAssembly plugin is [available here](#).

---

## Installation

Please refer to the WordPress documentation to [learn more about installing](#) or [managing plugins](#).

Instructions may vary depending on which version of WordPress you have.

Once the plugin is installed, enable it in the **WordPress Admin Dashboard** → **Plugins menu**.

---

## Publish Your Forms

To add your form to your WordPress page:

1. Install our WordPress Plugin (see above).
2. Copy the form ID. The ID can be found on the **Publish** page, at the end of the publicly available address (e.g., `http://www.tfaforms.com/123456`).
3. Replace `123456` with the ID of your form in the shortcode.
4. *If you're a FormAssembly Essentials plan or above customer, add the shortname attribute in the shortcode (see below).*

## Example Shortcodes

## FormAssembly Basic plans:

([tfaforms.com](https://tfaforms.com))

```
[formassembly formid=123456]
```

## FormAssembly Essentials, Team, or Enterprise plans:

(Most commonly: [organization.tfaforms.net](https://organization.tfaforms.net))

```
[formassembly formid=123456 shortname="organization"]
```

## FormAssembly Government plans:

(Most commonly: [organization.govfa.net](https://organization.govfa.net))

```
[formassembly formid=123456 shortname="organization.gov"]
```

---

## Publish with an iframe (Inline Frame)

If you'd rather display the form in an inline frame, or if your server doesn't support the default publishing method, add the `iframe` attribute to your tag. Please note that you'll need to add the server attribute even if using a Basic plan (as shown below).

For instance, a benefit to using an iframe would be to avoid conflicting CSS rules between the parent site and the embedded form.

```
[formassembly formid=123456 iframe=1]
```

OR

```
[formassembly formid=123456 shortname="organization" iframe=1]
```

---

## Publish a Workflow

```
[formassembly workflowid=1234]
```

OR

```
[formassembly workflowid=1234 shortname="organization"]
```

---

## Add Style

It is possible to add CSS to your shortcode to control the size of the form/iframe on the page. For example, you can define the width:

```
[formassembly formid=123456 iframe=1 style="width: 300px !important;"]
```

OR

```
[formassembly formid=123456 shortname="organization" iframe=1 style="width: 300px !important;"]
```

---

## FAQs

### Why is my form title not showing on my site?

When a form is [published with the REST API](#), as with our WordPress Plugin, it's assumed that the page will already have a title. To avoid possible duplicates, we have removed the form title.

To make the form title visible, use a Heading element from the **Add Content** → **Text & Image** menu.

### Why is my form not showing up at all?

Please check that the SSL settings of the form and the page to which you're publishing are the same, i.e., that both settings are enabled or that both settings are disabled.

To check the form settings, go to the **Display** page.

Additionally, you can try adding single quotes around your form ID in the shortcode, occasionally this will resolve the issue of a form not displaying.

\*As of August 2015, all new FormAssembly forms are SSL by default.

## Why is my form showing the shortcode instead of the form?

This occurs when your WordPress plugin is deactivated. Please ensure that your plugin is activated and enabled.

## My form is showing in a tiny font. How do I fix this?

The font is being set in the theme on the form, you can change this value in the [theme editor](#).

## My form is showing "Error: This response has already been processed" When Submitting a Form"

This error likely means that you have caching enabled for the page where your form is embedded.

You can test this by submitting a response on the form where you're seeing this error. After your test submission, [follow these instructions](#) before hitting the back button and trying again.

Following those instructions will purge the cache. If these instructions fix the error, then you will need to turn off caching on the pages where you have FormAssembly forms embedded.

## My responses do not show a "Referrer" when the respondent is using Firefox

You will need to add the first three lines of <head> code from your Publishing page into the header of your WordPress site.

First, you'll need to [download and install a header and footer plugin](#) to access the page header.

Next, navigate to the Publishing page for your form. In the HTML <head> code section, copy the first three lines of code as shown in the image below:

```
</> PUBLISH ON YOUR OWN WEBSITE
Copy the HTML code below (or download it). Then follow the instructions.
Please copy the below code and paste in the <head> section of your website.
<!-- FORM: HEAD SECTION -->
<meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
<meta name="referrer" content="no-referrer-when-downgrade">
Please copy the below code and paste in the <body> section of your website.
<!-- FORM: BODY SECTION -->
<div class="wFormContainer" >
  <div class="wFormHeader"></div>
Note: This is a HTML snippet. You may want it as a full HTML page.
```

Finally, paste this code into the header for your WordPress page using the previously installed WordPress header and footer plugin.
