Introduction

Drop-down menus can be linked together to help you show certain options based on your respondent's answers. The **parent** menu controls which subset of choices is visible in a **child** menu.

For instance, we have two drop-down menus: Continent (parent) and Country (child). If Europe is chosen in the parent menu, only European countries will be visible in the child menu.

Please Note: Menu Dependencies currently do not allow for importing via CSV dataset or use of the Autosuggest feature.

Creating Menu Dependencies

Step 1

To get started, create 2 [drop-down menus](#).

(You can also add the choices at this step, but save them for step 3 for a quicker and easier setup.)

Step 2

Once the menus are created, **select the child field**, open the **Advanced Options** of the sidebar, and open the **Menu Dependencies** options.

Step 3

From the Menu Dependencies options in the sidebar, select the parent field.

Then click the **choices** button on the floating toolbar for either the parent or the child field.

Step 4

You can either use the existing choices in the child menu, or type a new choice into the box and hit Enter. Newly added choices will be added into the child menu by default.

Drag the child choices so that they're listed underneath the corresponding parent choice.
