Introduction

With our new PDF features, we have also included the ability to define, at the account or admin level, custom headers and footers for your generated PDFs using HTML and CSS. When defined, these will display on every page of the PDF export regardless of where the PDF is generated.

Requirements

These features are available on Team plans and higher, or some legacy plans.

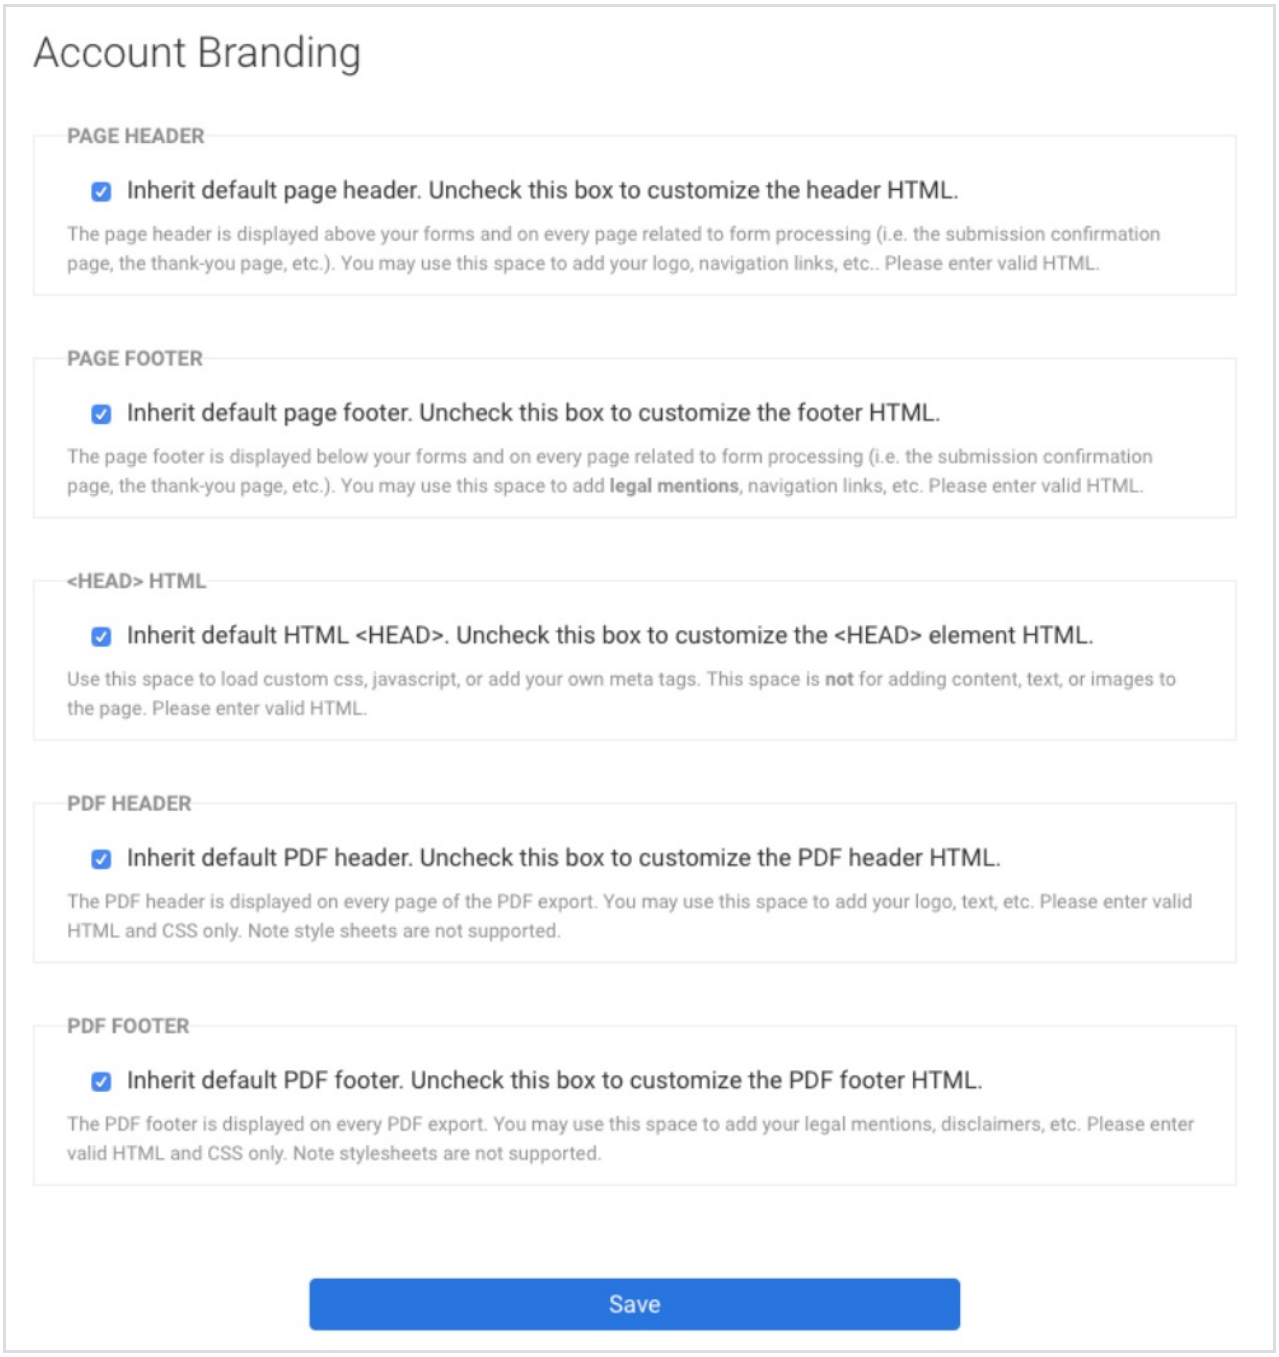

Setup

Note:

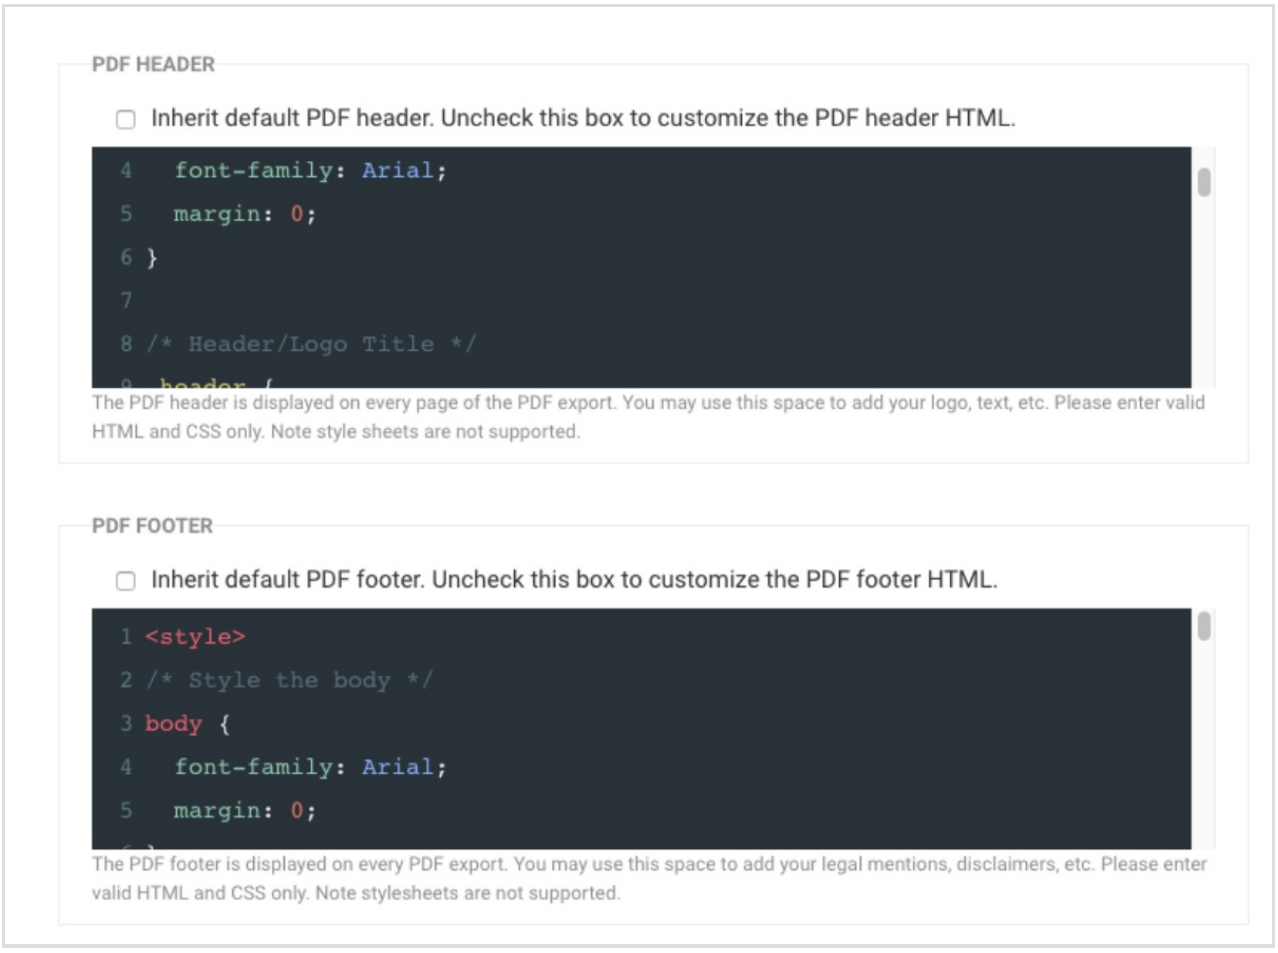

- Only a single set of style tags can be used at this time, though inline styles are also supported.
- External style sheets are not supported.
- Our Support Team does not support the writing or editing of custom code, such as HTML and CSS.

Advanced Branding for a Single User

If you would like to add branding to all of the forms on one user account, you'll find the Branding feature on the **General Settings** page. Click the **Define a header and footer for your forms** link to open the Branding Editor:

Next, uncheck the "inherit" option for PDF Header and/or PDF Footer. Insert your custom HTML and CSS and click "Save". Here is an example setup:

Export a PDF to view the branding.

Advanced Branding for your Instance (Administrator Settings)

If you are an admin who would like to set the branding for all PDFs generated by all users in your instance, you can do so from the **Admin Dashboard**. In the Dashboard, browse to **Forms → Form Header & Footer** or use the following URL:

```
https://YOUR-INSTANCE.net/admin/brandings/edit
```

Under Default PDF Header or Default PDF Footer, insert your custom HTML and CSS and click "Save".

> **Note:** All users will need to set their own branding to "Inherit" to inherit this default branding.

Custom Code Examples

> **Note**: Below are some common examples. You may need to edit these examples to fit your forms' needs. Our support team does not provide custom code and cannot help edit, write, or design custom code for your forms.

The following code can be added to your Account Branding as described in the "Setup" section above.

Hide the PDF Metadata

```
<style>
  .metadata-div {
    display: none;
  }
</style>
```

Hide the File List

```
<style>
 .file-list-div {
    display: none;
  }
</style>
```

Hide Both the Metadata and the File List

```
<style>
  .metadata-div {
    display: none;
  }
 .file-list-div {
    display: none;
  }
</style>
```
