Changes & Bug Fixes

- NEW FEATURES & ENHANCEMENTS

  - **New Form Collaboration with User Groups**:
    - FormAssembly Classic users will see an updated form collaboration experience with the added ability to share forms with user groups.

  - **Customize Your Workflow URLs:** Custom, branded URLs for workflows can now be set in workflow properties settings.

  - **Export Workflow Responses**: Export a CSV of a workflow's responses to see all associated response metadata and submitted form fields.

  - **Change Form Settings:** Customers can now update form settings, IP Anonymization, Spam Filter, and Review before Submit from their workflows — all without changing how it behaves in other workflows or at the form level.

- BUG FIXES

  - Fixed an issue where HTML tags were displayed on repeatable links in some form builds
  - Resolved an issue where Training Templates forms were no longer working in some account setups
  - Fixed an issue where a "Something went wrong" error could appear when attempting to report access the report page of a form
  - Fixed an issue where the All Forms page in the Admin Dashboard could fail to load after searching with accented characters
  - Resolved an issue where the PayPal connector was not available for FormAssembly Atlas users
  - Fixed an issue where lang query parameters could cause a redirect to a 404
  - Resolved a character spacing issue when viewing Validation Rules

- **ADDITIONAL NOTE: Form Security Enhancement — Updated Sanitation Library**
  - As of this release we've upgraded our form content sanitization system to improve security and performance.
    1. **What's changing:** Our system that validates and sanitizes CUSTOM CODE in forms is being updated to a newer version. This upgrade provides better protection against malicious code while maintaining compatibility with properly formatted custom code.

    2. **What you need to know:**
       1. Based on extensive testing, FormAssembly has determined that over 98% of forms in our database will experience no changes as a result of this update

2. For the small percentage of forms affected, changes are typically minor (cosmetic adjustments like attribute quoting or whitespace)

3. Custom code that is well-structured and non-malicious will not be affected

- IF YOU NOTICE CUSTOM CODE HAS BEEN REMOVED FROM A FORM ON YOUR ACCOUNT:
    1. **Check your form's Revision History** - Your previous custom code is preserved in earlier versions

    2. **Review the removed code** - The new sanitization system only removes code that is:
        1. Malformed or improperly structured

        2. Classified as potentially malicious

    3. **Reformat and reapply** - Correct any structural issues in your code and save it again

    4. **Contact FormAssembly Support if needed** - If you believe your code was incorrectly flagged, reach out to our Support team with:
        1. Your form ID

        2. The specific custom code that was removed

        3. A description of what the code was intended to do
