IMPROVEMENTS

- Images you upload in the form builder that are larger than 2,400 pixels on either side are now automatically resized, and the builder shows a message with the original and new size. Uploads over 100 megapixels are rejected with a message. This helps keep forms and generated PDFs fast and reliable.
- CyberSource connector: added support for CyberSource's message-level encryption (MLE). CyberSource will require MLE on REST API calls beginning in March 2027. You can now upgrade your connector by uploading an MLE key (.p12 file) and its password on the connector's setup screen. Existing connectors continue to work as they do today until you upload a key. A single key can be used for every connector on the same merchant ID, and Test and Live keys are separate. See the CyberSource connector help article for instructions.

BUG FIXES

- Fixed an issue that could cause form pages and login to fail with an error, or load slowly, for some accounts during periods of high traffic.
- Fixed an issue where the Excel connector's Configure tab could stay on a loading spinner and time out for Microsoft 365 accounts with a large OneDrive. Workbooks can now be selected without waiting for the full OneDrive to load.
- Fixed an issue where reauthorizing a Salesforce connection could switch it to a different Salesforce user than the one originally authorized, causing records to be created under the wrong user.
- Fixed an issue where themes without a background image caused forms to make unnecessary extra requests when loading, improving form load performance.
